**This procedure generate all permutation of an n by n identity matrix.**

**It uses the Maple function permute(x): which returns a list of all the permutations of x, where x is a list of elements**

**example:**

**permute([a,b,c]) = [ [a, b, c], [a, c, b], [b, a, c], [b, c, a], [c, a, b], [c, b, a] ]**

```

> PIn := proc(n)
    local L1, No, i;
    L1 := [1];

    for i from 1 to n - 1 do #` generate the first row as a list
        L1 := [op(L1), 0];      # 1, 0, 0, .. .., 0
    end do;

    L1 := permute(L1);      # get the matrix as a list of a list
    No := numbperm(L1);     # get number of permutations
    L1 := permute(L1);      # obtain the list of permutations

    for i from 1 to No do    # convert list to matrix form
        print(M[i] = Matrix(L1[i]));
    end do;

end proc;
